CONTAINING THESE COMPOUNDS, THEIR USE AND PREPARATION**

This application is a division of Serial Number 09/618,702, filed July 18, 2000.

Field of the Invention

- The invention relates to carboxylic acid amides that have an inhibitory effect on
10 telomerase, and their use in the treatment of pathophysiological processes which are
characterised by an increased telomerase activity, e.g. tumour diseases such as carcinomas,
sarcomas and leukaemias.

15 **Background of the Invention**

- The last decade of oncological research has made it possible for the first time to achieve a
molecular understanding of the regulatory mechanisms involved in the formation of
tumours. These include, for example, the function of oncogenes, tumour suppressor genes,
growth factors, receptors, signal transduction cascades, pro- and anti-apoptotic genes in
20 controlling cell growth, differentiation, migration and cell death. These new findings have
also shown, however, that cancer is a multifactorial disease at the molecular level, during
the onset of which tissues may undergo malignant degeneration as a result of different
mechanisms. This heterogeneity of the malignant cells in turn explains the clinical
problems of tumour therapy.

25

- In 1965 Hayflick postulated (Hayflick, *Exp. Cell Res.* 37, 614-636 (1965)) that the limited
proliferative lifespan of normal somatic cells, replicative senescence, can act as a tumour
suppressing mechanism. This hypothesis was supported by experimental work which
showed that the overcoming of replicative senescence is a prerequisite for the malignant
30 transformation of cells (Newbold et., al. in *Nature*, 299, 633-636 (1989); Newbold and
Overell in *Nature*, 304, 648-651 (1983)).

However, only in the last few years has there been any understanding of the molecular mechanisms by which somatic cells achieve the state of replicative senescence.

The ends of eukaryotic chromosomes, the telomeres, consist of simple repetitive sequences
5 the integrity of which is essential for the function and structure of the chromosomes.
However, linear chromosomes lose a certain length of their telomeres in each round of DNA replication, a phenomenon which was recognised by Watson back in 1972 (Watson in Nature New Biol. 239, 197-201 (1972)). The cumulative loss of telomeric DNA over numerous cell divisions constitutes the basis for the limited replicative potential of somatic
10 cells, whereas more than 85% of all tumours in humans reactivate an enzyme, telomerase, in order to compensate for the loss of telomeres and thus become immortal (see Shay and Bacchetti in European Journal of Cancer, 33, 787-791 (1997)).

Telomerase in humans is a ribonucleoprotein (RNP) which is made up of at least one
15 catalytic subunit (hTERT), and one RNA (hTR). Both components have been molecularly cloned and characterised. Biochemically, telomerase is a reverse transcriptase which uses a sequence fragment in hTR as matrix in order to synthesise a strand of telomeric DNA (Morin in Cell 59, 521-529 (1989)). Methods of identifying telomerase activity and also methods of diagnosing and treating replicative senescence and immortality by modifying
20 telomeres and telomerase have already been described (Morin in Cell 59, 521-529 (1989); Kim et al. in Science 266, 2011-2014 (1994)).

Inhibitors of telomerase can be used for tumour therapy since somatic cells, unlike tumour cells, are not dependent on telomerase.

25 Moreover, US Patent No. 3,940,422 *inter alia* describes the compound trans-3,4-dimethoxy-cinnamic acid-N-anthranilic acid-amide which has antiallergenic properties in particular.

10

The carboxylic acid amides of the above general formula I may be obtained, for example, by the following methods which are known *per se*:

a. acylating an amine of general formula

15

wherein

R₃ and B are as hereinbefore defined, with a carboxylic acid of general formula

20

wherein

R₁, R₂, R₄, R₅ and A are as hereinbefore defined, or the reactive derivatives thereof.

25

The acylation is conveniently carried out with a corresponding halide or anhydride in a solvent such as methylene chloride, chloroform, carbon tetrachloride, ether,

tetrahydrofuran, dioxane, benzene, toluene, acetonitrile or sulpholane, optionally in the presence of an inorganic or organic base such as triethylamine, N-ethyl-diisopropylamine, N-methyl-morpholine or pyridine at temperatures between -20 and 200°C, but preferably at temperatures between -10 and 160°C.

5

However, the acylation may also be carried out with the free acid, optionally in the presence of an acid-activating agent or a dehydrating agent, e.g. in the presence of isobutyl chloroformate, thionyl chloride, trimethylchlorosilane, hydrogen chloride, sulphuric acid, methanesulphonic acid, p-toluenesulphonic acid, phosphorus trichloride, phosphorus

10 pentoxide, N,N'-dicyclohexylcarbodiimide, N,N'-dicyclohexyl-carbodiimide/N-hydroxysuccinimide or 1-hydroxy-benzotriazole, N,N'-carbonyldiimidazole or N,N'-thionyldiimidazole or triphenylphosphine/carbon tetrachloride, at temperatures between -20 and 200°C, but preferably at temperatures between -10 and 160°C.

15

b. In order to prepare a carboxylic acid amide of general formula I which contains a carboxy group:

converting a compound of general formula

20

wherein

R₁ to R₅, A and B are as hereinbefore defined, with the proviso that A or B or A and B contain a group which can be converted into a carboxy group, into a compound of general formula I which contains a carboxy group.

25

Examples of a group which can be converted into a carboxy group include carboxyl groups protected by protecting groups, such as the functional derivatives thereof, e.g. the unsubstituted or substituted amides, esters, thioesters, trimethylsilyl esters, orthoesters or iminoesters thereof, which are conveniently converted into a carboxyl group by hydrolysis,

5

the esters thereof with tertiary alcohols, e.g. the tert. butyl ester, which are conveniently converted into a carboxyl group by treating with an acid or by thermolysis, and

10 the esters thereof with aralkanols, e.g. the benzyl ester, which are conveniently converted into a carboxyl group by hydrolysis.

The hydrolysis is conveniently carried out either in the presence of an acid such as hydrochloric acid, sulphuric acid, phosphoric acid, acetic acid, trichloroacetic acid, trifluoroacetic acid or mixtures thereof or in the presence of a base such as lithium 15 hydroxide, sodium hydroxide or potassium hydroxide in a suitable solvent such as water, water/methanol, water/ethanol, water/isopropanol, methanol, ethanol, water/tetrahydrofuran or water/dioxane at temperatures between -10 and 120°C, e.g. at temperatures between ambient temperature and the boiling temperature of the reaction mixture.

20 The conversion of a tert. butyl or tert. butyloxycarbonyl group into a carboxy group can also be carried out by treating with an acid such as trifluoroacetic acid, formic acid, p-toluenesulphonic acid, sulphuric acid, hydrochloric acid, phosphoric acid or polyphosphoric acid optionally in an inert solvent such as methylene chloride, chloroform, benzene, toluene, diethylether, tetrahydrofuran or dioxane, preferably at temperatures between -10 25 and 120°C, e.g. at temperatures between 0 and 60°C, or thermally, optionally in an inert solvent such as methylene chloride, chloroform, benzene, toluene, tetrahydrofuran or dioxane and preferably in the presence of a catalytic amount of an acid such as p-toluenesulphonic acid, sulphuric acid, phosphoric acid or polyphosphoric acid, preferably at the boiling temperature of the solvent used, e.g. at temperatures between 40 and 120°C.

30

200607557000

The conversion of a benzyloxy or benzyloxycarbonyl group into a carboxy group may also be carried out hydrogenolytically in the presence of a hydrogenation catalyst such as palladium/charcoal in a suitable solvent such as methanol, ethanol, ethanol/water, glacial acetic acid, ethyl acetate, dioxane or dimethylformamide, preferably at temperatures

- 5 between 0 and 50°C, e.g. at ambient temperature, and at a hydrogen pressure of 1 to 5 bar.

If according to the invention a compound of general formula I is obtained which contains a hydroxy group, this may be converted into a corresponding sulphonyloxy compound by means of a sulphonyl halide, or

10

if a compound of general formula I is obtained which contains a cyano group, this can be converted by means of hydrazoic acid into a corresponding tetrazolyl compound, or

15

if a compound of general formula I is obtained which contains an amino or imino group with a basic hydrogen atom, this can be converted by acylation or sulphonylation into a correspondingly acylated compound or into a corresponding prodrug compound, or

20

if a compound of general formula I is obtained which contains a carboxy group, this can be converted into a compound which contains a group which may be converted into a carboxy group *in vivo*, or

if a compound of general formula I is obtained which contains one or two carboxy groups, this can be converted by reduction with a complex metal hydride into a compound which contains one or two hydroxymethyl groups.

25

The subsequent sulphonylation is conveniently carried out with a corresponding halide in a solvent such as methylene chloride, chloroform, carbon tetrachloride, ether, tetrahydrofuran, dioxane, benzene, toluene, acetonitrile or sulpholane, optionally in the presence of an inorganic or organic base such as triethylamine, N-ethyl-diisopropylamine, N-methylmorpholine or pyridine at temperatures between -20 and 200°C, but preferably at temperatures between -10 and 160°C.

100037555-010302

2002755/040300

The subsequent preparation of a compound of general formula I which contains a tetrazole group is preferably carried out in a solvent such as benzene, toluene or dimethylformamide at temperatures between 80 and 150°C, preferably between 120 and 130°C. The hydrazoic acid required is conveniently liberated during the reaction from an alkali metal azide, e.g. from sodium azide, in the presence of a weak acid such as ammonium chloride. The reaction may also be carried out with another salt or derivative of hydrazoic acid, preferably with aluminium azide or tributyl tin azide, and the tetrazole compound optionally obtained in this way is then liberated from the salt contained in the reaction mixture by acidification with a dilute acid such as 2N hydrochloric acid or 2N sulphuric acid.

The subsequent acylation or sulphonylation or the subsequent conversion into a corresponding prodrug compound is preferably carried out with a corresponding acid halide in a solvent such as methylene chloride, chloroform, carbon tetrachloride, ether, tetrahydrofuran, dioxane, benzene, toluene, acetonitrile or sulpholane, optionally in the presence of an inorganic or organic base such as triethylamine, N-ethyl-diisopropylamine, N-methyl-morpholine or pyridine at temperatures between -20 and 200°C, but preferably at temperatures between -10 and 160°C.

The subsequent conversion of a carboxy group into a group which may be converted into a carboxy group *in vivo* is preferably carried out by esterification with a corresponding alcohol or by alkylation of the carboxy group. The esterification is conveniently carried out in a solvent or mixture of solvents such as methylene chloride, benzene, toluene, chlorobenzene, tetrahydrofuran, benzene/tetrahydrofuran or dioxane, but preferably in an excess of the alcohol reactant in the presence of a dehydrating agent, e.g. in the presence of hydrochloric acid, sulphuric acid, isobutyl chloroformate, thionyl chloride, trimethylchlorosilane, hydrochloric acid, sulphuric acid, methanesulphonic acid, p-toluenesulphonic acid, phosphorus trichloride, phosphorus pentoxide, 2-(1H-benzotriazol-1-yl)-1,1,3,3-tetramethyluronium-tetrafluoroborate, N,N'-dicyclohexylcarbodiimide, N,N'-dicyclohexylcarbodiimide/N-hydroxysuccinimide,

- N,N'-carbonyldiimidazole or N,N'-thionyldiimidazole, triphenylphosphine/carbon tetrachloride or triphenylphosphine/diethyl azodicarboxylate, optionally in the presence of a base such as potassium carbonate, N-ethyl-diisopropylamine or N,N-dimethylamino-pyridine, conveniently at temperatures between 0 and 150°C, preferably at temperatures
5 between 0 and 80°C, and the alkylation is conveniently carried out with a corresponding halide in a solvent such as methylene chloride, tetrahydrofuran, dioxane, dimethylsulphoxide, dimethylformamide or acetone, optionally in the presence of a reaction accelerator such as sodium or potassium iodide and preferably in the presence of a base such as sodium carbonate or potassium carbonate or in the presence of a tertiary organic
10 base such as N-ethyl-diisopropylamine or N-methyl-morpholine, which may simultaneously serve as solvent, or optionally in the presence of silver carbonate or silver oxide at temperatures between -30 and 100°C, but preferably at temperatures between -10 and 80°C.

- 15 The subsequent reduction is preferably carried out in the presence of a complex metal hydride such as lithium aluminium hydride or lithium triethyl borohydride in a solvent such as tetrahydrofuran, conveniently at the boiling temperature of the solvent used.

- In the reactions described hereinbefore, any reactive groups present such as hydroxy,
20 carboxy, amino, alkylamino or imino groups may be protected during the reaction by conventional protecting groups which are cleaved again after the reaction.

For example, a protecting group for a hydroxy group may be a trimethylsilyl, acetyl, benzoyl, methyl, ethyl, tert.butyl, trityl, benzyl or tetrahydropyranyl group,

25 protecting groups for a carboxy group may be a trimethylsilyl, methyl, ethyl, tert.butyl, benzyl or tetrahydropyranyl group and

protecting groups for an amino, alkylamino or imino group may be a formyl, acetyl, trifluoroacetyl, ethoxycarbonyl, tert.butoxycarbonyl, benzyloxycarbonyl, benzyl,
30

methoxybenzyl or 2,4-dimethoxybenzyl group and additionally, for the amino group, a phthalyl group.

- Any protecting group used is optionally subsequently cleaved for example by hydrolysis in
5 an aqueous solvent, e.g. in water, isopropanol/water, acetic acid/water,
tetrahydrofuran/water or dioxan/water, in the presence of an acid such as trifluoroacetic
acid, hydrochloric acid or sulphuric acid or in the presence of an alkali metal base such as
sodium hydroxide or potassium hydroxide or aprotically, e.g. in the presence of
iodotrimethylsilane, at temperatures between 0 and 120°C, preferably at temperatures
10 between 10 and 100°C.

- However, a benzyl, methoxybenzyl or benzyloxycarbonyl group is cleaved, for example
hydrogenolytically, e.g. with hydrogen in the presence of a catalyst such as
palladium/charcoal in a suitable solvent such as methanol, ethanol, ethyl acetate or glacial
15 acetic acid, optionally with the addition of an acid such as hydrochloric acid at temperatures
between 0 and 100°C, but preferably at temperatures between 20 and 60°C, and at a
hydrogen pressure of 1 to 7 bar, but preferably 3 to 5 bar. A 2,4-dimethoxybenzyl group,
however, is preferably cleaved in trifluoroacetic acid in the presence of anisol.
20 A tert.butyl or tert.butyoxy carbonyl group is preferably cleaved by treating with an acid
such as trifluoroacetic acid or hydrochloric acid or by treating with iodotrimethylsilane
optionally using a solvent such as methylene chloride, dioxan, methanol or diethylether.

- A trifluoroacetyl group is preferably cleaved by treating with an acid such as hydrochloric
25 acid, optionally in the presence of a solvent such as acetic acid at temperatures between 50
and 120°C or by treating with sodium hydroxide solution optionally in the presence of a
solvent such as tetrahydrofuran at temperatures between 0 and 50°C.

- A phthalyl group is preferably cleaved in the presence of hydrazine or a primary amine
30 such as methylamine, ethylamine or n-butylamine in a solvent such as methanol, ethanol,
isopropanol, toluene/water or dioxan at temperatures between 20 and 50°C.

- The compounds of general formulae II to IV used as starting materials are known from the literature in some cases but may also be prepared by methods known from the literature (cf. for example Fulton et al. in J.Chem.Soc. 1939, page 200, S.Sano et al. in 5 Chem.Commun. 6, page 539 (1997) and D.H.Klaubert et al. in J.Med.Chem. 24, 742-748 (1981)).

Moreover, the compounds of general formula I obtained may be resolved into their enantiomers and/or diastereomers, as mentioned hereinbefore. Thus, for example, 10 compounds with at least one optically active carbon atom may be separated into their enantiomers.

Thus, for example, the compounds of general formula I obtained which occur as racemates may be separated by methods known *per se* (cf. Allinger N. L. and Eliel E. L. in "Topics in 15 Stereochemistry", Vol. 6, Wiley Interscience, 1971) into their optical enantiomers and compounds of general formula I with at least 2 stereogenic centres may be resolved into their diastereomers on the basis of their physical-chemical differences using methods known *per se*, e.g. by chromatography and/or fractional crystallisation, and, if these 20 compounds are obtained in racemic form, they may subsequently be resolved into the enantiomers as mentioned above.

Furthermore, the compounds of formula I obtained may be converted into the salts thereof, particularly for pharmaceutical use into the physiologically acceptable salts with inorganic or organic acids. Acids which may be used for this purpose include for example 25 hydrochloric acid, hydrobromic acid, sulphuric acid, methanesulphonic acid, phosphoric acid, fumaric acid, succinic acid, lactic acid, citric acid, tartaric acid or maleic acid.

Moreover, if the new compounds of formula I contain an acidic group such as a carboxy group, they may subsequently, if desired, be converted into the salts thereof with inorganic 30 or organic bases, particularly for pharmaceutical use into the physiologically acceptable salts thereof. Suitable bases for this purpose include for example sodium hydroxide,

10037555-010302

potassium hydroxide, arginine, cyclohexylamine, ethanolamine, diethanolamine and triethanolamine.

- As already mentioned hereinbefore, the carboxylic acid amides of general formula I and
5 the salts thereof, particularly the physiologically acceptable salts thereof, have an
inhibiting effect on telomerase.

The inhibiting effect of the carboxylic acid amides of general formula I on telomerase was
investigated as follows:

10

Materials and methods:

1. Preparation of nuclear extracts from HeLa cells: Nuclear extracts were prepared according to Dignam (Dignam et al. in Nucleic Acids Res. **11**, 1475-1489 (1983)). All the
15 steps were carried out at 4°C, all the equipment and solutions were pre-cooled to 4°C. At least 1×10^9 HeLa-S3 cells growing in suspension culture (ATCC catalogue number CCL-2.2) were harvested by centrifuging for 5 minutes at 1000 x g and washed once with PBS buffer (140 mM KCl; 2.7 mM KCl; 8.1 mM Na₂HPO₄; 1.5 mM KH₂PO₄). After the cell volume had been determined, the cells were suspended in 5 times the volume of
20 hypotonic buffer (10 mM HEPES/KOH, pH 7.8; 10 mM KCl; 1.5 mM MgCl₂) and then left for 10 minutes at 4°C. After centrifuging for 5 minutes at 1000 x g the cell pellet was suspended in twice the volume of hypotonic buffer in the presence of 1 mM DTE and 1 mM PMSF and broken up with a Dounce homogeniser. The homogenised material was made isotonic with 0.1 volume of 10-fold saline buffer (300 mM HEPES/KOH, pH 7.8;
25 1.4 M KCl; 30 mM MgCl₂). The cell nuclei were separated from the ingredients of the cytoplasm by centrifuging and then suspended in twice the volume of nuclear extraction buffer (20 mM HEPES/KOH, pH 7.9; 420 mM KCl; 1.5 mM MgCl₂; 0.2 mM EDTA; 0.5 mM DTE; 25% glycerol). The nuclei were broken up using a Dounce homogeniser and incubated for 30 minutes at 4°C with gentle stirring. Any insoluble ingredients were
30 removed by centrifuging for 30 minutes at 10.000 rpm (SS-34 Rotor). Then the nuclear extract was dialysed for 4-5 hours against AM-100 buffer (20 mM tris/HCl, pH 7.9; 100

EDEOT0755ZED00

mM KCl; 0.1 mM EDTA; 0.5 mM DTE; 20% glycerol). The nuclear extracts obtained were frozen in liquid nitrogen and stored at -80°C.

2. Telomerase test: The activity of telomerase in nuclear extracts from HeLa cells was determined using the method described by Morin (Morin in Cell 59, 521-529 (1989)). The nuclear extract (up to 20 µl per reaction) was incubated for 120 minutes at 30°C in a volume of 40 µl in the presence of 25 mM Tris/HCl pH 8.2, 1.25 mM dATP, 1.25 mM TTP, 6.35 µM dGTP; 15 µCi α -³²P-dGTP (3000 Ci/mmol), 1 mM MgCl₂, 1 mM EGTA, 1.25 mM spermidine, 0.25 U RNasin, and 2.5 µM of an oligonucleotide primer (for example TEA-fw [CAT ACT GGC GAG CAG AGT T], or TTA GGG TTA GGG TTA GGG) (= telomerase reaction). If the inhibition constant of potential telomerase inhibitors was to be determined, these were also added to the telomerase reaction in a concentration range of from 1 nM to 100 µM.
- The reaction was then stopped by the addition of 50 µl of RNase stop buffer (10 mM tris/HCl, pH 8.0; 20 mM EDTA; 0.1 mg/ml of RNase A 100 U/ml of RNase T1; 1000 cpm of an α -³²P-dGTP labelled, 430 bp DNA fragment) and incubation was continued for a further 15 minutes at 37°C. Proteins present in the reaction mixture were cleaved by the addition of 50 µl of proteinase K buffer (10 mM tris/HCl, pH 8.0; 0.5% SDS; 0.3 mg/ml of proteinase K) and subsequent incubation for 15 min at 37°C. The DNA was purified by extracting twice with phenol-chloroform and precipitated by adding 2.4 M ammonium acetate; 3 µg tRNA and 750 µl ethanol. Then the precipitated DNA was washed with 500 µl of 70% ethanol, dried at ambient temperature, taken up in 4 µl of formamide probe buffer (80% (V/V) formamide; 50 mM of tris-borate, pH 8.3; 1 mM EDTA; 0.1 (w/v) of xylene cyanol; 0.1% (w/v) bromophenol blue) and separated by electrophoresis on a sequence gel (8% polyacrylamide, 7 M urea, 1 x TBE buffer). The DNA synthesised by telomerase in the presence or absence of potential inhibitors was identified and quantified by Phospho-Imager Analysis (Molecular Dynamics) and in this way the concentration of inhibitor which inhibits the telomerase activity by 50% (IC₅₀) was determined. The radiolabelled DNA fragment to which the RNase stop buffer had been added was used as an internal control for the yield.

The following Table gives the IC₅₀ values of some inhibitors by way of example:

Trans-3-nitrocinnamic acid-N-(2-methoxycarbonyl-phenyl)-amide

965 mg (5.0 mmol) of trans-3-nitrocinnamic acid are refluxed for 20 minutes in 3 ml of thionyl chloride after the addition of one drop of dimethylformamide. Then the mixture is evaporated to dryness *in vacuo* and the resulting acid chloride is dissolved in 10 ml of dioxane.
